

Falcon Network

A High-Performance, Wide Area Interconnect

Soumya Basu, Ittay Eyal, Emin Gün Sirer

May 17, 2016

IC3

Motivation

- Every consensus protocol suffers with laggy network
- Nakamoto consensus suffers by:
 - Losing mining revenue
 - Wasting hash power
 - ... resulting in centralization pressure!
- In fact, the effect of the block size on the network latency is a highly contentious point!

Current Relay Network

- Bitcoin Fast Relay Network (BFRN)
 - Big improvement over P2P layer of Bitcoin through:
 - Minimal validation
 - Hand-optimized topology
 - **Compression**
 - Not actively maintained
 - Compression software required at end hosts
 - Optimizes for bandwidth, not latency

Falcon Network

- Falcon Network achieves gains through
 - Minimal validation
 - Hand-optimized topology
 - ***Cut-through routing***
- No special software required on clients
- Fundamentally faster than other techniques
- Orthogonal to compression (BIP 152)

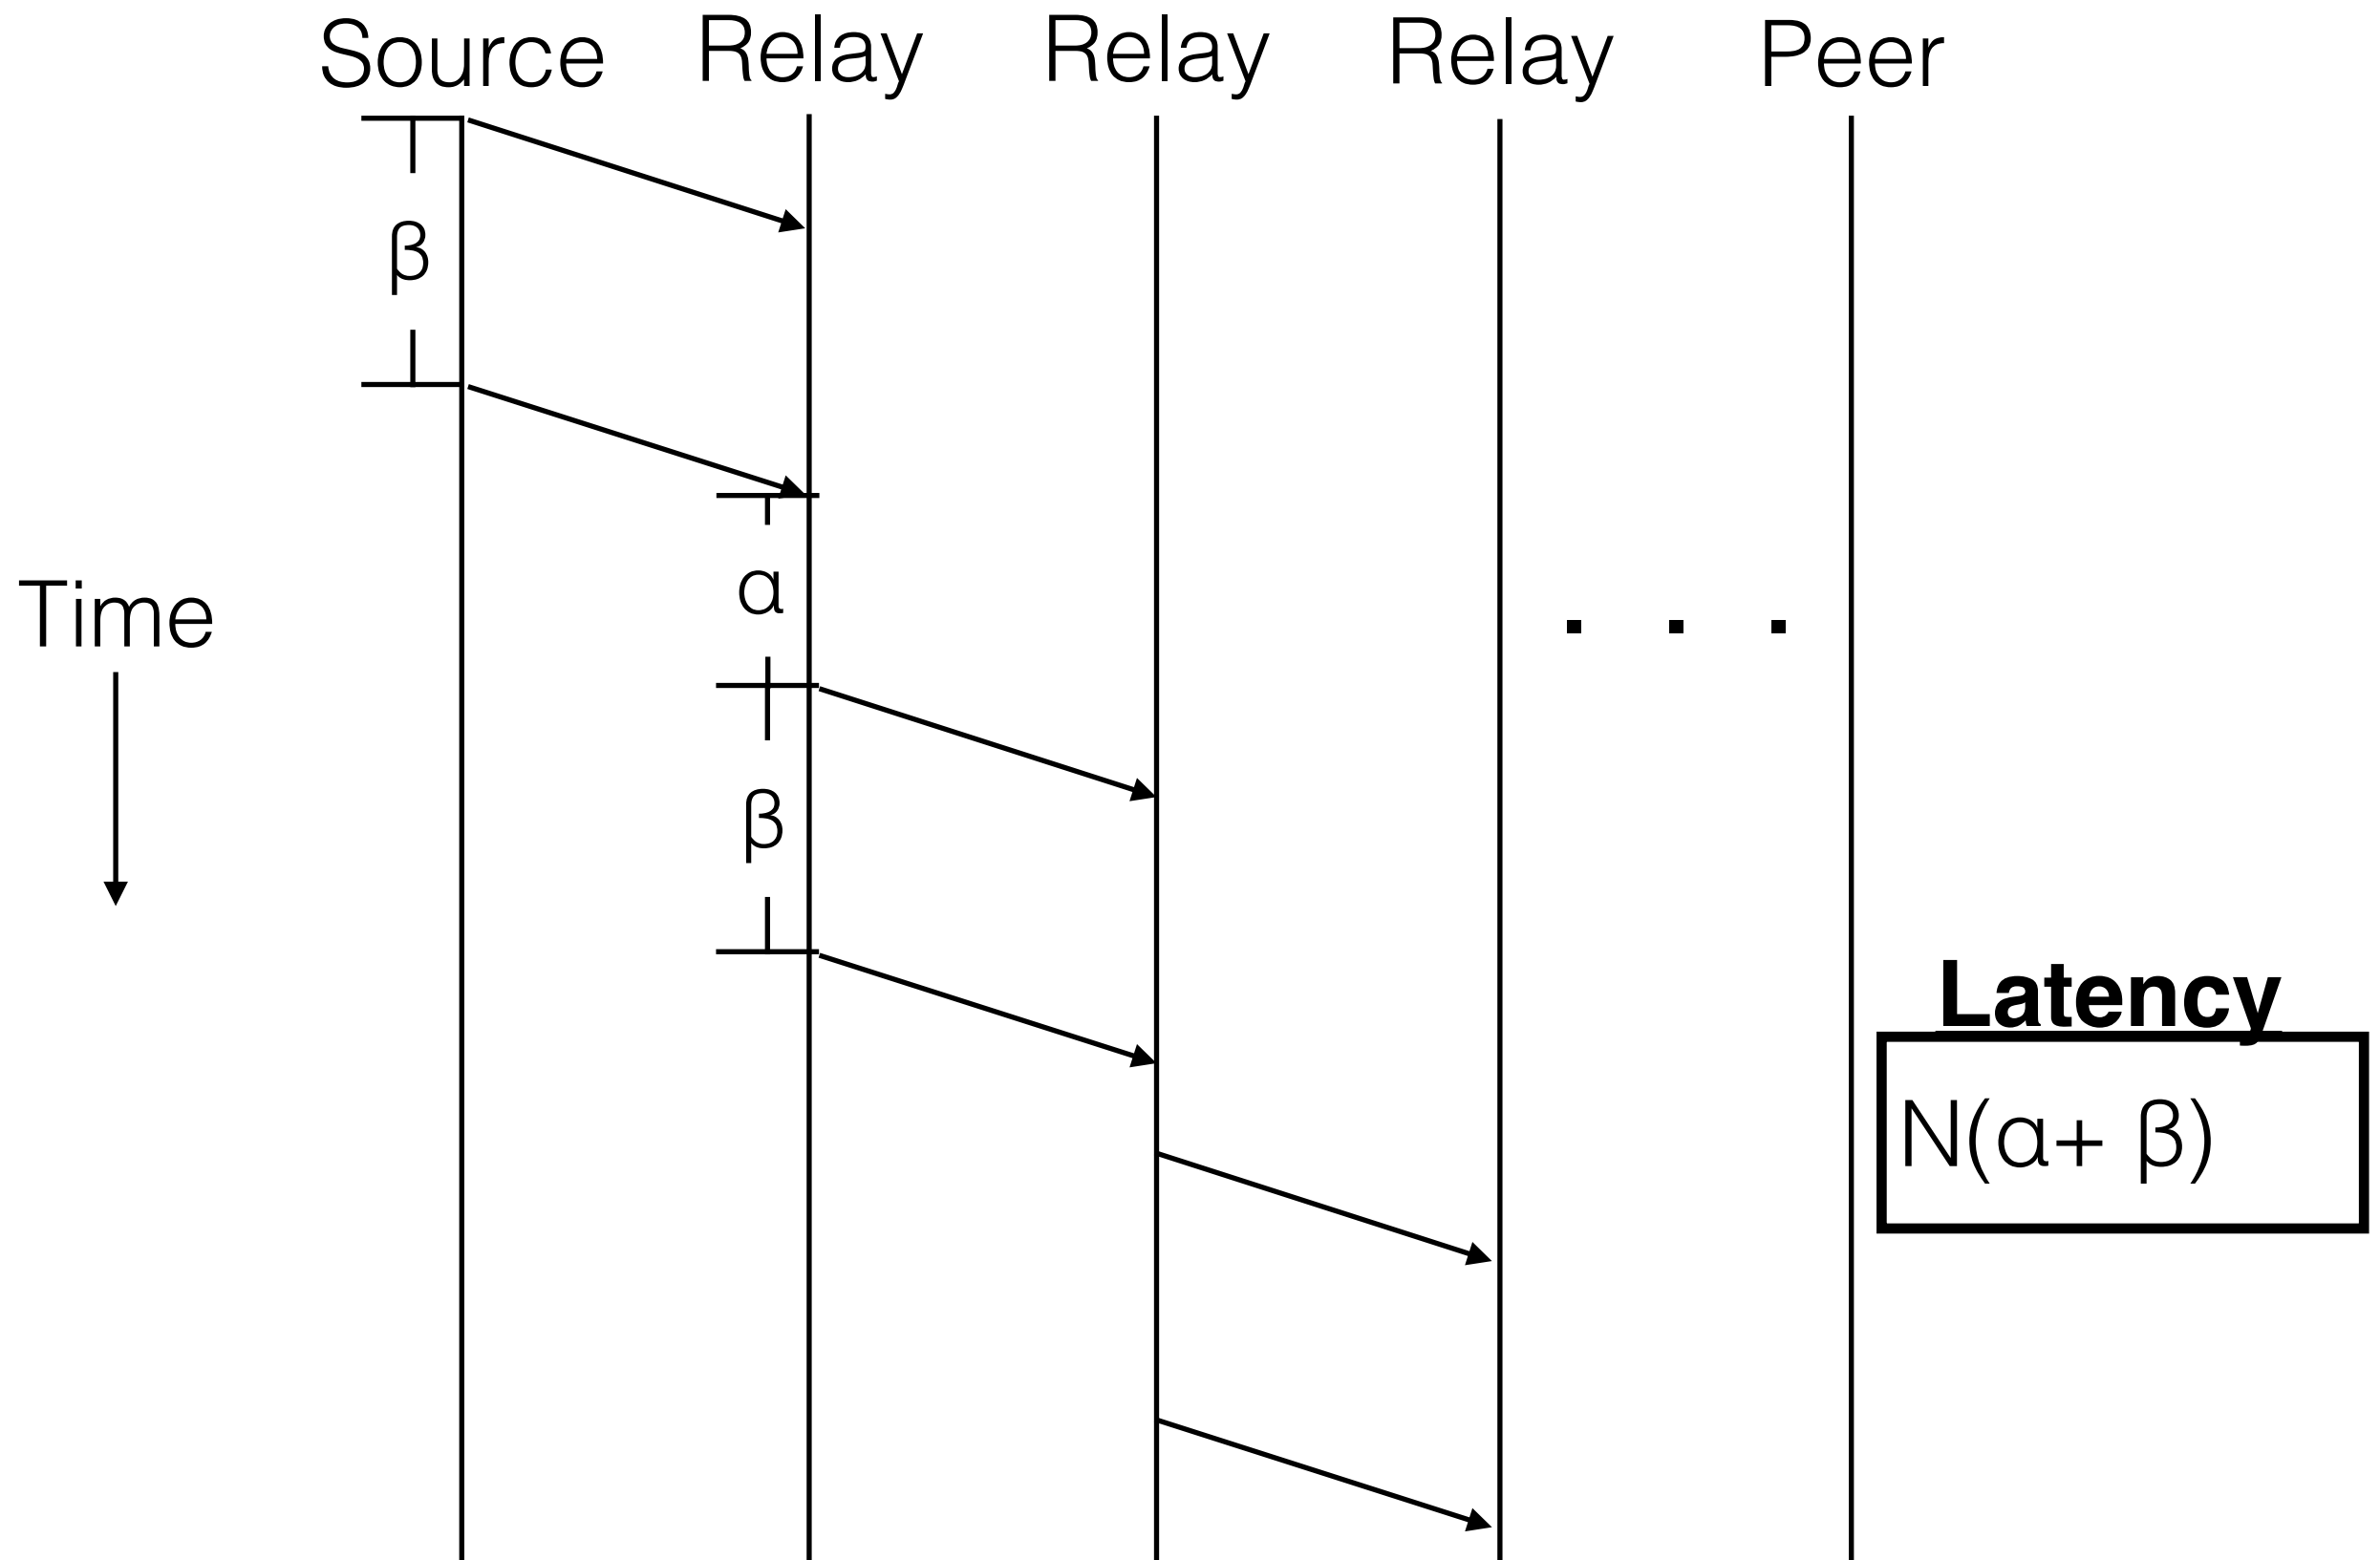

Bitcoin P2P Routing

Bitcoin P2P Routing

BFRN Routing

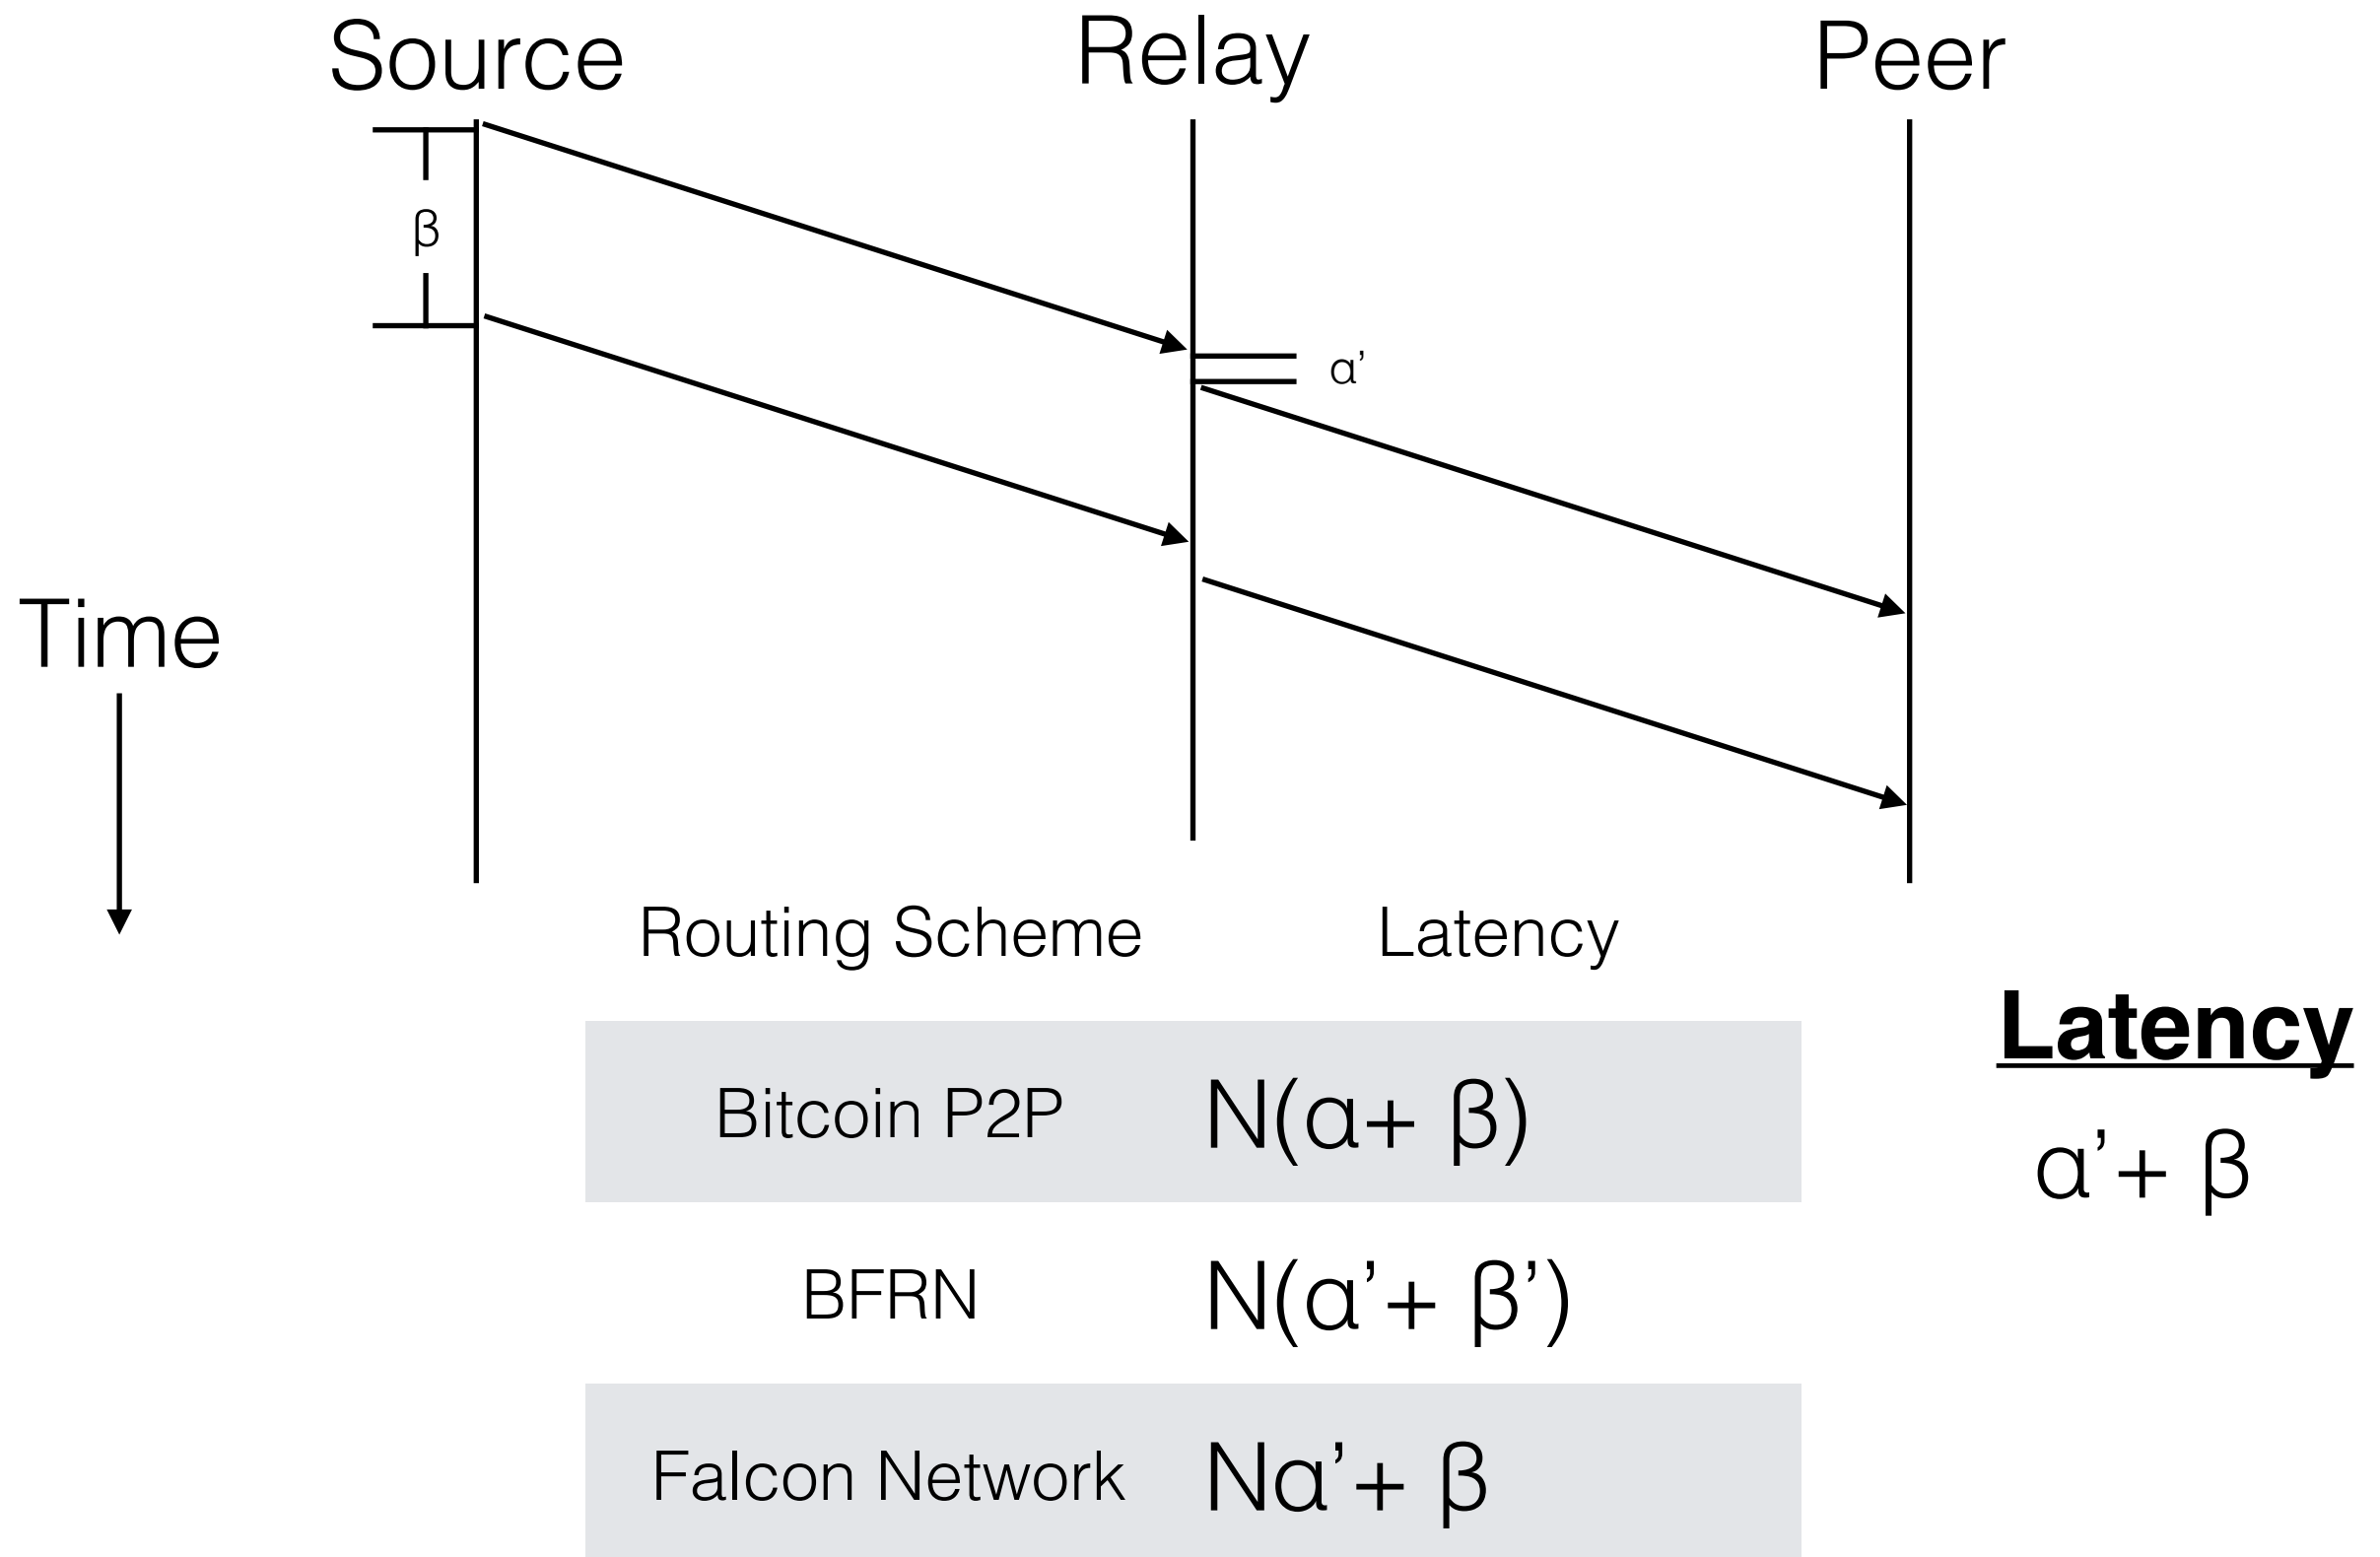

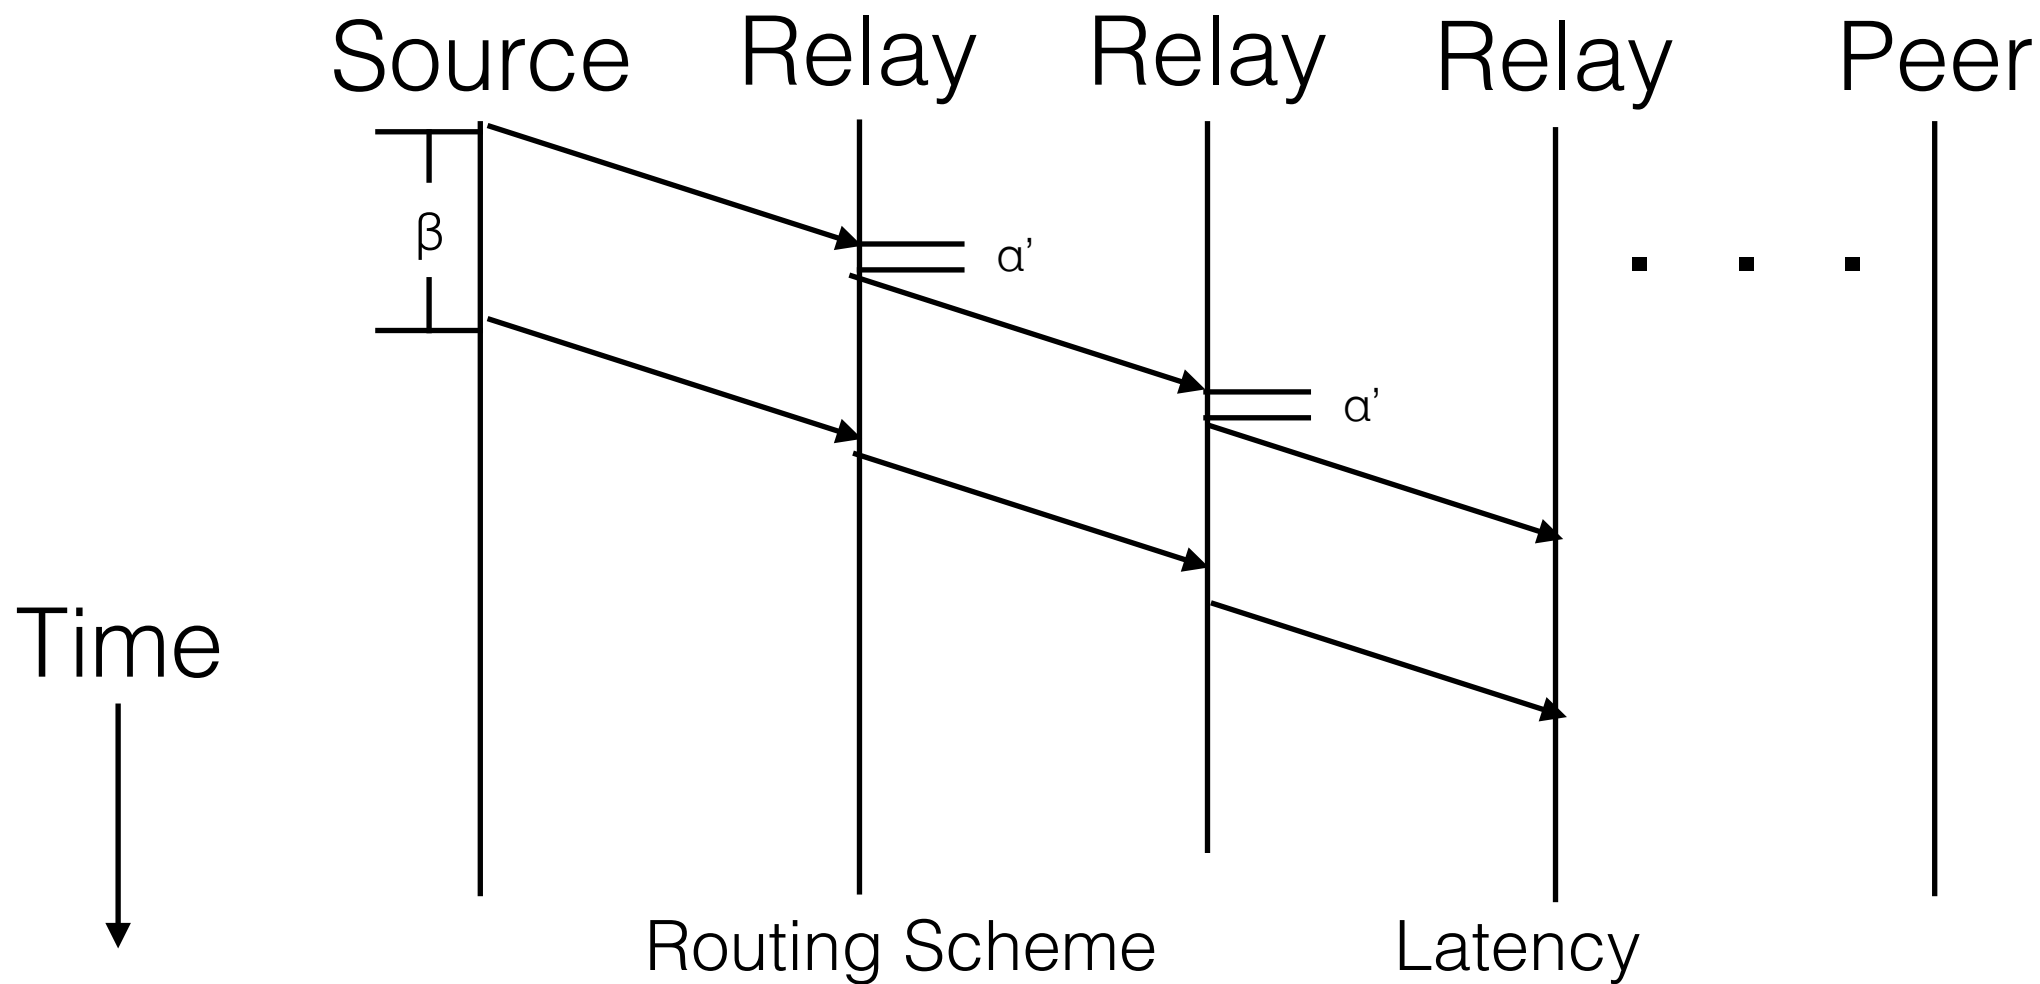

BFRN Routing

Falcon Network Routing

Falcon Network Routing

| | |
|----------------|-----------------------|
| Bitcoin P2P | $N(\alpha + \beta)$ |
| BFRN | $N(\alpha' + \beta')$ |
| Falcon Network | $N\alpha' + \beta$ |

Latency
 $N\alpha' + \beta$

Network Operation Center

Takeaways

- Rethinking of the Bitcoin network layer using a principled approach
- Significantly faster and more scalable than alternatives
- Orthogonal to compression

Looking Forward

- Automatically managing topology
- Measure the network characteristics of cryptocurrencies
- Unique vantage point as a fast relay service

Public Release
