# Central Retinal Projections

# ***Suprachiasmatic Nucleus (SCN)***

SCN Divisions: core & shell

# *Suprachiasmatic Nucleus (SCN)*

## *Core*

*bilateral inputs from retina, LGNv, midbrain raphe,  
Inputs from ganglion cells containing photopigment (melanopsin)  
neurons contain vasoactive intestinal polypeptide (VIP)*

## *Shell*

*inputs from brain stem, hypothalamus, basal forebrain, limbic  
neurons contain vasopressin (AVP) and GABA*

## *Function*

*Individual neurons: circadian oscillators (maintain rhythmic firing rate in culture)  
Coupled to form a pacemaker  
Lesions abolish sleep/wake cycle and other hormonal & behavioral rhythms  
Serves as a primary biological clock*

*Lesions of suprachiasmatic nucleus abolish light/dark cycles of activity in a rat*

# Pretectum

## Nucleus of the Optic Tract (NOT)

### **Inputs**

*Bilateral retinal projections*

*Visual cortex (e.g. V1, MT, MST)*

### **Outputs**

*Edinger-Westphal nucleus*

*LGN*

### **Neuronal properties**

*Respond to fast motion*

*Binocular*

### **Function**

*Stabilize retinal image*

*Pupillary control*

*Role in fixation and optokinetic nystagmus (OKN)*

# *Pretectum plays an important role in the pupillary reflex*

*Pretectum controls the action of the pupillary constrictor muscle via its projection to both Edinger-Westphal nuclei.*

*Normal pupillary reflex*

*Left Efferent Pupil Defect*

Figure 2 Retrograde labeling from LGN and pretectum colocalize with melanopsin immunostain. a-b. Coronal sections through LGN showing HRP-stained tracks made by tracer injections (arrows). Injections in a are restricted to the parvocellular layers; track in b extends to the magnocellular layers. Scale bars = 2 mm. c. Confocal images of retrograde rhodamine label (red) from LGN injection (arrow, left) and melanopsin immunostaining (AlexaFluor, green; arrow, middle). Colocalization of labels appears yellow (arrow, right). Scale bar = 50  $\mu$ m. d. Cells retrogradely labeled with rhodamine from injections in pretectum (arrows, left) and labeled for melanopsin immunoreactivity (arrows, middle). Colocalization appears yellow (arrows, right). Scale bar = 100  $\mu$ m. e. Photoreceptive ganglion cell (arrow; scale bar = 50  $\mu$ m) identified by autofluorescent granules in cell body (inset) and targeted for intracellular recording and HRP-staining in the unlabeled, in vitro retina. Tracing of the entire dendritic tree is shown on the right (arrow indicates axon; scale bar = 200  $\mu$ m).

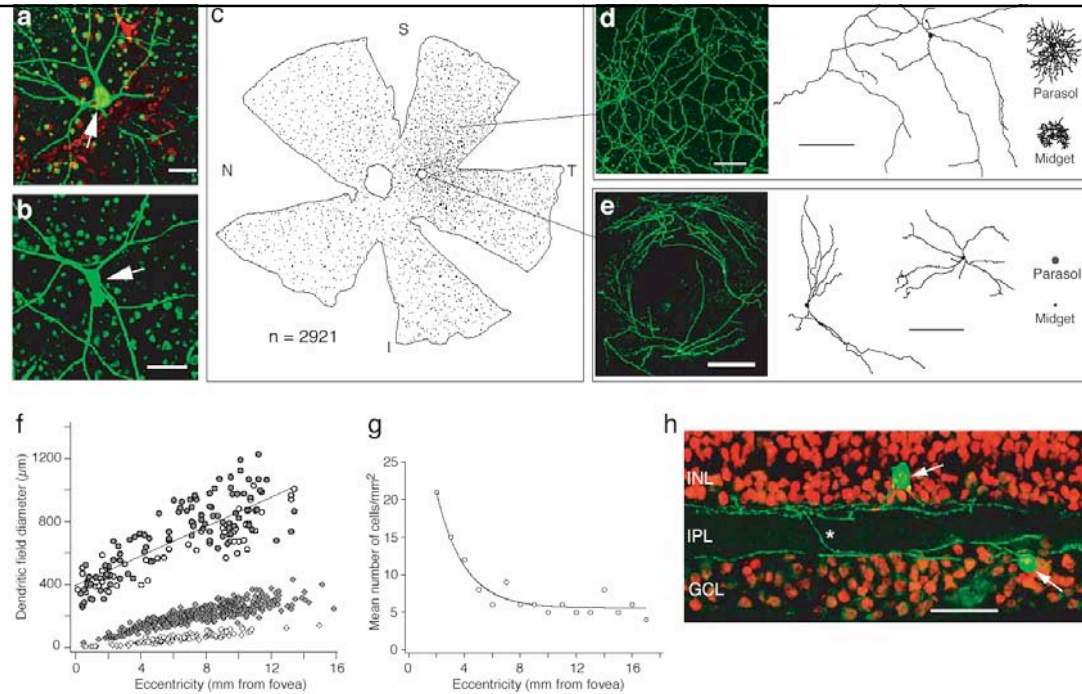

Figure 1. Morphology of melanopsin-immunoreactive ganglion cells. a. Human melanopsin immunoreactive cell (arrow); propidium iodide red counterstain. Scale bar = 50  $\mu\text{m}$ . b. Macaque melanopsin immunoreactive cell (arrow). Scale bar = 50  $\mu\text{m}$ . c. Macaque retina tracing; dots represent melanopsin immunoreactive cells. T, N, S, and I, are temporal, nasal, superior and inferior retina respectively. d. Immunoreactive cells in peripheral retina (left; scale bar = 100  $\mu\text{m}$ ). Tracing of a peripheral HRP-stained giant cell (right; scale bar = 200  $\mu\text{m}$ ). Peripheral parasol and midget cells (far right) are shown for comparison. e. Immunoreactive cells encircling the fovea (left; scale bar = 200  $\mu\text{m}$ ). Tracings of two HRP-stained giant cells ~1-1.5 mm from the fovea (right; scale bar = 200  $\mu\text{m}$ ). Circles (far right) indicate size of foveal parasol and midget cells. f. Dendritic field size of melanopsin cells versus eccentricity (inner cells, filled circles; n = 93)(outer cells, open circles; n = 63). Parasol (filled diamonds; n = 333) and midget cells (open diamonds; n = 93) are shown for comparison. g. Mean cell density of immunoreactive cells versus eccentricity (total = 614 cells in 78 1-mm<sup>2</sup> samples). h. Dendritic arbors (green) of melanopsin immunoreactive cells (arrows) from stacked confocal images of 5 consecutive vertical sections (25  $\mu\text{m}$  thick). Outer stratifying cell's soma is displaced to the INL. GCL, IPL, and INL are ganglion cell layer, inner plexiform layer, and inner nuclear layer, respectively. Scale bar = 50  $\mu\text{m}$ .

# Accessory Optic System (AOS)

## Inputs

*from contralateral retina (slow conducting fibers)  
topographic projections from cortex*

## Outputs

*AOS --> Inferior olive --> cerebellum*

## Neuronal properties

*Neurons are selective to direction of slow motion*

## Function

*Stabilize image on the retina*

*Involved in optokinetic nystagmus (reflex stabilizing retinal image)*

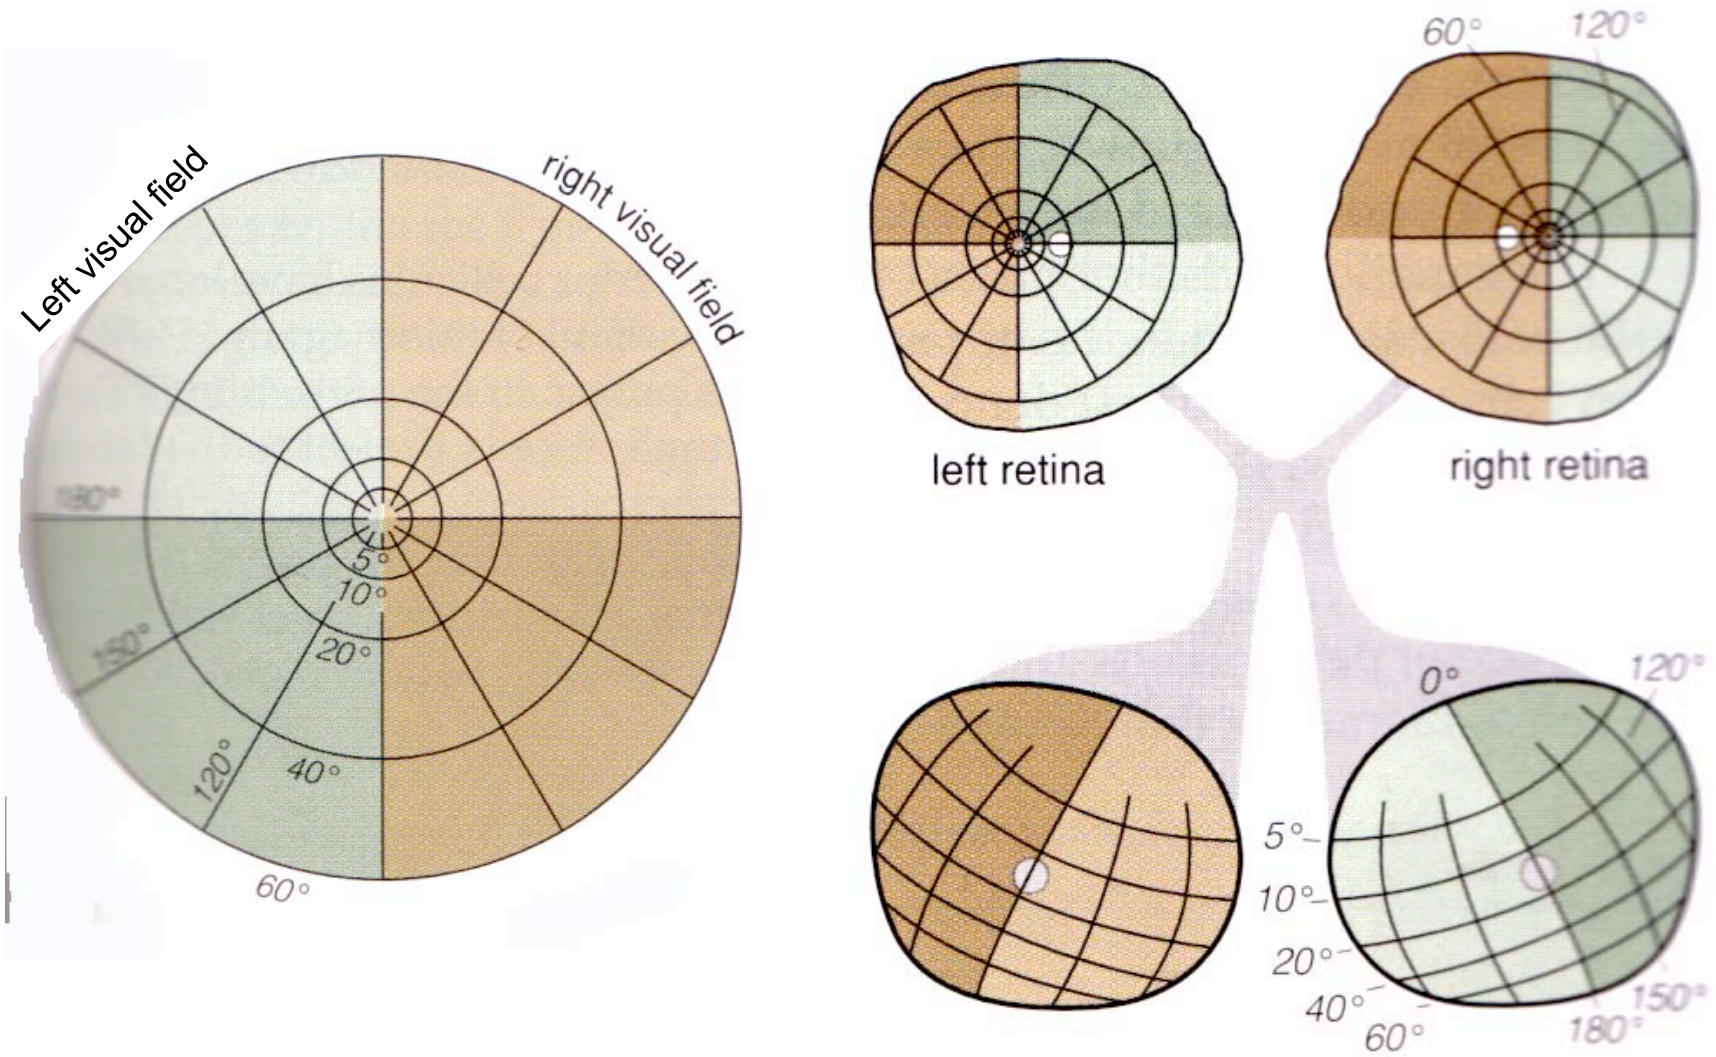

*Neurons detect retinal slip; these signals activate eye muscles to cancel retinal slip*

*AOS works with vestibular system to detect self-motion and stabilize eye & head in space*

*Deep layers*

# Superior Colliculus

## Superficial layers (I,II,III)

- ❖ **inputs from retina**  
*10% of ganglion cells (few M, some  $\gamma$ )*
- ❖ **inputs from cortex**  
*ipsilateral, foveal, topographic from layer 5  
FEF (frontal eye fields)  
extrastriate*
- ❖ **Retinotopic map**  
*Central 10° occupied 30% of surface  
Contralateral visual field in primates (contra/ipsi retina)*
- ❖ **Visually responsive neurons**  
*Center/surround organization; not selective for stimulus shape  
Binocular  
Slowly conducting*
- ❖ **Behavioral modulation of visual responses**  
*enhancement before saccade into receptive field*
- ❖ **Function**  
*initiation of eye movements  
involved in directing spatial attention*

# Superior Colliculus

## **Deep layers (V, VI)**

- ❖ **Inputs from all sensory systems**
- ❖ **Outputs to brain stem (related to motor control. E.g. eye movements)**
- ❖ **Locations in SC represents space around the animal**
  - Multisensory responses*
  - (e.g. acoustic, tactile, visual originating from the same region of space)*
  - Enhanced response to multisensory stimulation from the same region of space*
- ❖ **Movement fields**
  - Neurons active before eye movements (saccades) of specific amplitude and direction*
  - (e.g 20° from any orbital position)*
  - topographic map of movement fields across SC*
- ❖ **Function**
  - visual orienting reflexes*
  - multisensory integration in goal oriented behaviors*

## Properties of the 3 most numerous retinal-LGN cells

	<b>P-cells</b>	<b>M-cells</b>	<b>Blue - cells</b>
<b>number</b>	<i>80%</i>	<i>10%</i>	<i>6%</i>
<b>Soma size</b>	<i>medium</i>	<i>large</i>	<i>small</i>
<b>RF size</b>	<i>small</i>	<i>large</i>	<i>large</i>
<b>conduction velocity</b>	<i>slow</i>	<i>fast</i>	<i>very slow</i>
<b>color</b>	<i>red-green</i>	<i>no</i>	<i>blue-yellow</i>

# ***Organization and properties of LGN***

## ***Receptive field properties***

### *Parvocellular neurons*

*red-green color, high spatial resolution, low contrast sensitivity,  
low temporal resolution*

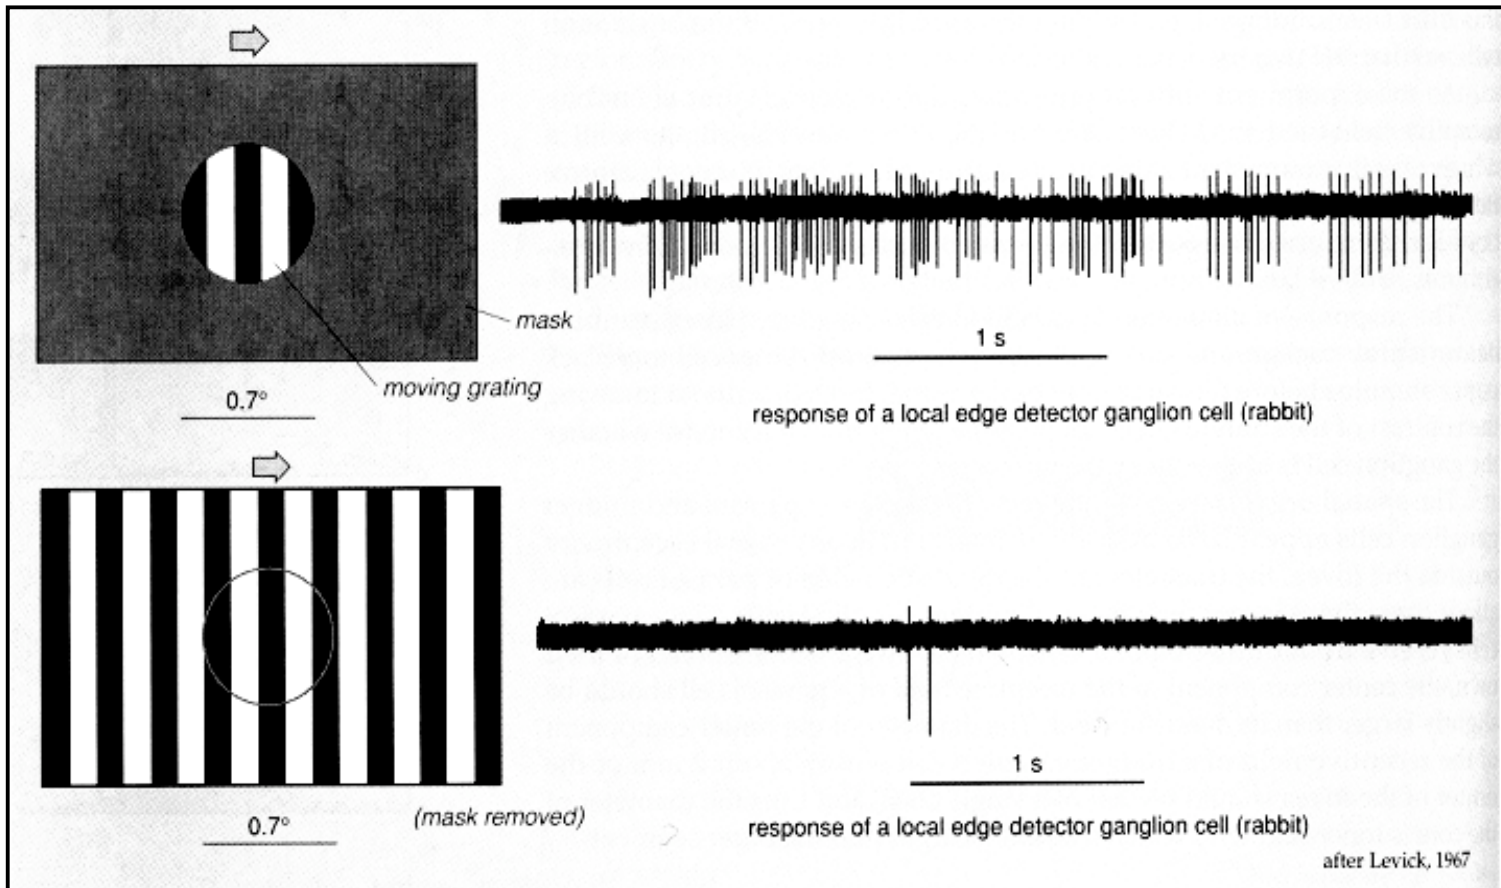

### *Magnocellular neurons*

*high contrast sensitivity, high flicker rates (speeds), low spatial resolution*

### *Blue neurons*

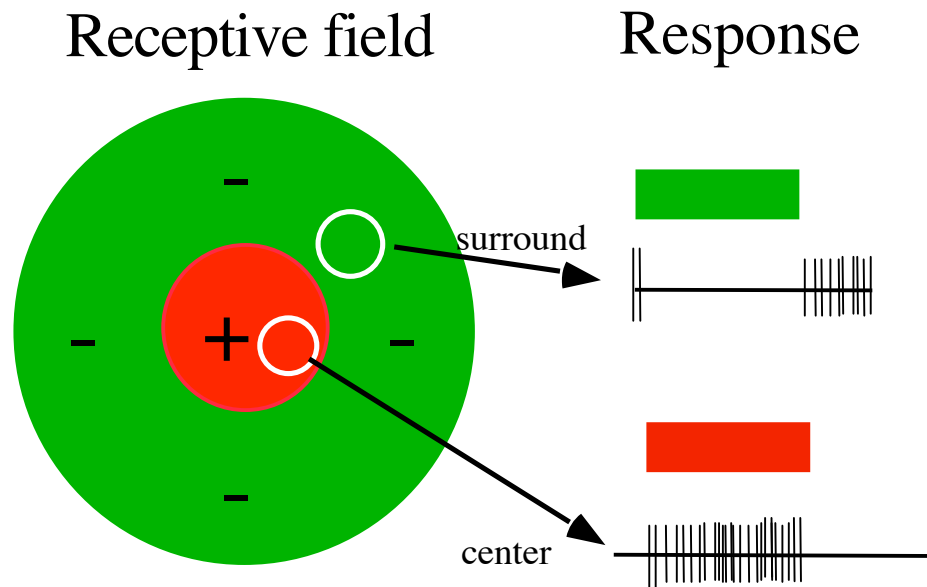

*yellow-blue color, low spatial resolution, low contrast sensitivity,  
low temporal resolution*

## *Inhibitory Surrounds of Receptive Fields in the retina and LGN*

## *Red-green P-cells in the LGN*

are both spatially and chromatically opponent

# *M-cells in the LGN*

are spatially, but not chromatically, opponent

## *Blue ON-yellow OFF cell in the LGN*

are chromatically but not spatially opponent

# *Spatial contrast sensitivity*

*Low  
contrast*

*high  
contrast*

*low*

*spatial frequency*

*high*

# Contrast Sensitivity Function

## *Spatiotemporal Properties of P and M-cells in the LGN*

## Effects of P and M lesions in the LGN

# Effects of LGN Lesions in Primates

## **P- lesion**

*loss of acuity*

*loss of color vision*

*loss of sensitivity to fine, slowly  
moving or flickering patterns*

## **M - lesion**

*intact acuity*

*intact color vision*

*loss of sensitivity to coarse, fast  
moving or flickering patterns*
