MESA - MANUFACTURING EXECUTION SYSTEM APPLICATION

MESA is an integrated relational database system for discrete part manufacturing (a computerized record-keeping system)

A relational database system is a database in which the data is perceived by the user as tables (and nothing but tables)

Operations include:

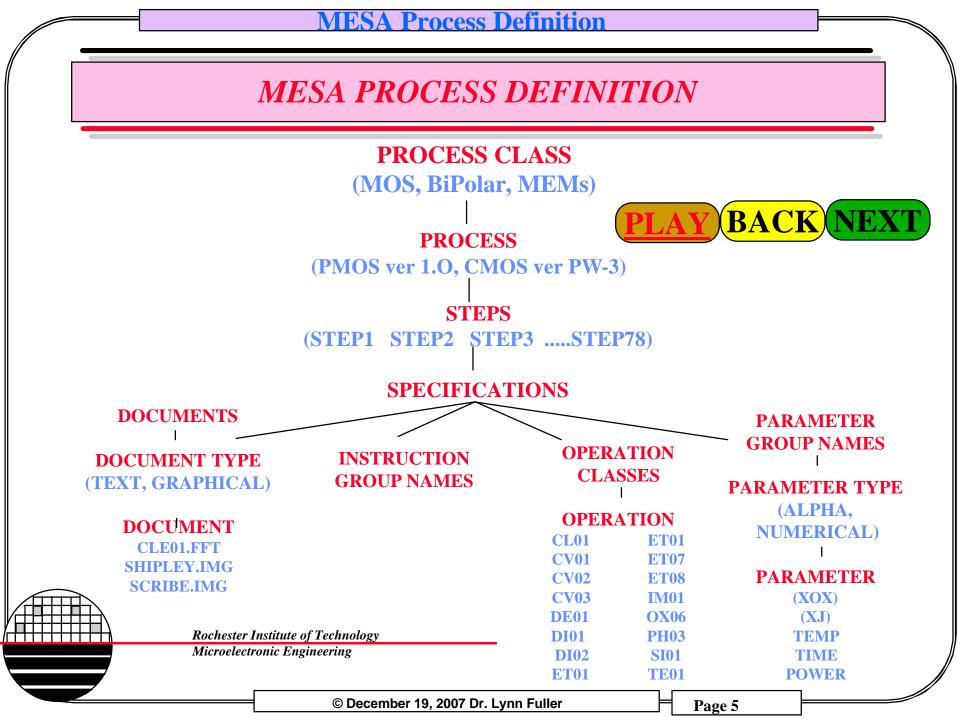

Adding new tables to the database Inserting new data into existing tables Retrieving data from existing tables Updating data in existing tables Deleting data from existing tables Removing existing tables from the database Quarrying database tables for specific information

Rochester Institute of Technology

Microelectronic Engineering

APPROACH

Sketch out the process flow Define any new operations not already in MESA Define instructions for each step Define parameters for each step Define specifications for each step Create documents Define the process

CREATE DOCUMENTS

Documents are text or graphical files stored on a network drive. The J:/ drive resides on a PC in building 17. The J:/mesadoc directory is normally used for these documents.

Example document showing how to electrically activate the cantilever

SUMMARY

Process definition is at the core of basic work-in-progress tracking software. MESA needs a process definition in order to do transactions such as MOVE, MOVE-IN, START, SHIP, Etc.

HOMEWORK – MESA PROCESS DEFINITION

Create your own process in MESA. (Three steps is enough) Use your name or your initials in naming the various new operations, process, specifications, paramter groups, etc.

1. RCA Clean, Grow Oxide ...
